

1994 AGRICULTURAL CENSUS

FINAL REPORT

**Division of Agriculture and Mineral Resources
Ministry of Resources and Development**

March 13, 2003

1994 Palau National Agriculture Census Report

INTRODUCTION

In 1899, Palau became a German protectorate following the purchase of the Caroline and Mariana Islands, excluding Guam, from Spain. Fisheries and coconut plantations were established, and cassava was introduced. The Japanese took military control of the Caroline Islands in 1914. Agricultural settlements were established on the island of Babeldaob. Today, subsistence crop production remains the main agricultural enterprise in the Republic of Palau with vegetable crop production slowly gaining popularity. The major crops include cassava, taro, sweet potato, banana, papaya, and coconut.

In 1978, with the Palau islands still under the Trusteeship agreements with the United States under the Trust Territory of the Pacific Islands (TTPI), the first Palau agricultural census supervised by the United Nations was never completed. A second attempt was made in 1989 to do an agricultural census in Palau, but that one also ended with incomplete results.

The 1994 Palau Agricultural census was the first to be attempted by the Government of Palau, and was also the first one to be successfully completed

Geography

Climate

History

Economy

Although the overall development objective of Palau is to achieve an economic self reliance, based on a free and vibrant market economy, this objective is being pursued with a slow and realistic approach.

The Republic of Palau has untapped economic resources in its unparalleled natural beauty. Recently, an international interest in Palau in terms of tourism is growing as the number of airlines

and tourist-related services continues to grow. In 1994, a total of 35,030 tourists visited Palau, an increase of 9 percent from the previous year. The same year there were 655 motel, hotel, and guest rooms in Palau.

In 1994, there was also an increase in offshore fishing in Palau. A total of 268 fishing vessels were fishing in the waters of Palau. These fishing vessels landed a total of 2,029 metric tons of offshore catches in the same year.

During the same year (1994) imports to Palau continued to grow. A total of \$48.6 million worth of goods were imported, an increase of about 8 percent from the previous year. A total of 92 cargo ships called in Palau's ports, an increase of 46 percent from the previous year.

In 1994, imported agricultural commodities included 3,356,385 pounds of staples (rice, flour, and potatoes), which was 40,015 pounds less than the staples imported the previous year. The Republic also imported 1,631,971 pounds of meat (beef, pork, and poultry) which was 283,000 pounds more than the meat imported the previous year. Vegetables and fruits imported in 1994 totalled 1,339,197 pounds and 748,669 pounds greater than fruits and vegetables imported the previous year.

The imported agricultural commodities has been increasing gradually each year even when more and more farms are joining the farming community, seemingly flooding the markets with local farm produces. It is because of the increase of the foreign population in the Republic that the local produces still can't satisfy the huge demand of both the foreign and local consumers, and will continue to grow to a much larger scale with the increasing population of foreigners in the Republic.

Census Methodology

The methodology for carrying out the Census was a combination of complete count and sample survey. Thus the Census was basically a two-part enumeration. The first part involved all 710 households randomly picked according to the household listing of the Republic of Palau provided by the office of the Census and Statistics. The second part of the enumeration was designed to cover 100 percent of all agricultural holdings belonging to households, as identified in the first part.

I Use of the census

The information contained in this first Palau National Agriculture Census will provide the needed guidelines to farmers, their representatives, the government, and many other groups of people to evaluate schemes, upgrade programs, plan and execute activities concerned with food and agricultural production in the Republic of Palau.

II Taking the Census

A. Questionnaires

The content of the questionnaire of the 1994 Palau National Agriculture Census was similar to the questionnaires of the 1989 Palau Agricultural Census which was not completed. Some changes were made to the questionnaires to provide more meaningful and useful statistics, and to facilitate the processing of the collected data. Another reason for the changes was to make the questionnaire more understandable to both the enumerator and the person being enumerated or providing the information.

B. Training

One of the immediate objectives of the project was to train a national staff on all aspects of agriculture census procedures including data collections, processing, analyzing, retrieval, and dissemination. Extensive training programs were organized at various levels to achieve this objective. The training for the census field staff was organized in stages. The first stage of training was for supervisors. In this training 2 Agriculturists (a Forester and a Livestock officer) from the Division of Agriculture, Ministry of National Resources and Development participated. These supervisors with knowledge at previous National Agriculture census in the late 70's and late 80's which were not completed made the changes in the questionnaires and trained the National Agriculture census staff. The second stage was the selection of enumerators in which 21 persons representing each of the 14 states of the Republic of Palau excluding the southwest islands participated. The training course covered topics like an introduction to the Agriculture census concepts and definitions, the questionnaire, examples of filled in questionnaires and the use of the enumerators manual. The exercises included a week of practicing in the state of Airai and Aimeliik where dozens of households were enumerated, and a week of sessions in classroom. The enumerators were also trained in methods of updating the household list; handling of surveying instruments and methods of physical measurements of land areas. A preliminary test in elementary mathematics was held at different locations as part of the training procedure. In addition to the enumerators, 6 officials from the Department of Statistics also worked as enumerators. The supervisors were Agricultural Extension Officers however, some senior officers from the Department of Statistics and the Department of Agriculture also acted as supervisors. Because of the excellent support given by the Head of Department of Agriculture the fieldwork and the recruitment of the enumerator proceeded smoothly. The enumerators recruited from the open market were generally satisfactory, however, to try to improve the quality of the fieldwork the alternative of employing teachers as part-time enumerators should be re-considered in the next census.

CHAPTER 11. AGRICULTURE AND LAND TENURE SYSTEM IN SAMOA

Food Crops

Taro is the most commonly grown root crop and the preferred starchy staple. The roots, in addition to providing a highly digestible carbohydrate, have a high mineral content and are a good source of calcium. Under favorable conditions of well distributed rainfall, this crop is known to ensure a continuous supply of food through the simple expedient of planting in direct proportion to requirement. The crop matures in seven to nine months and is frequently ratooned with the second ratoon being harvested after about four months. In areas with less rainfall, planting may be restricted to the rainy months, leading to a short break in supply. Taro is particularly well adapted to the high rainfall conditions of Western Samoa and in the wetter parts of the country it is planted throughout the year. Recently, it has gained significance as an important export commodity.

The taro *Colocasia esculenta* in this National Agricultural census of the Republic of Palau totaled the most commonly grown root crop in numbers, reaching nearly 2 million in all 14 States enumerated. In the taro patch illustration (figure _____), we show an example of different taro patch sections and the Palauan methods of planting and irrigating the taro patches. In this census, the taro was recognized by enumerators as a crop that is being well spaced and in most cases a crop that was easily characterized and tabulated by operators and therefore speeding data collection by the enumerators. The methods used by operators for planting, tabulating, and collecting statistics goes back to the old ways of taro propagation before introduction of foreign methods of propagating taro were introduced. Taro is the oldest crop ever propagated in the Republic of Palau and was eaten as a starchy staple and also provided leaves together with fruits for diets similar to vegetable diets to provide vitamins to the Palauans during the old days.

The Palauan ways of identifying and characterizing taro patches by name and plant quantities are shown in the figure.

Urars are those small sharp corners of a taro patch that are planted after *bluu* and *ulecharuu* had been planted. Most cases of *urars* do not exceed 25 taro plants due to their smallness in size. A *ulecharuu* in cases is similar to a *urars* but consist of more taro plants that do not exceed 50 plants. They are plots in the taro patches that do not make up a *bluu* which is the main plot. *Bluu* is a plot in the taro patch always in a square shape that in most cases takes up most of the space in the taro patches. Most *bluus* are similar in characteristics and contain the same number of taro plants between operators sharing the taro patches, but changes in characteristics and in numbers of plants between communities, hamlets, and states from 80 to 100 number of taro plants per case. *Uleboel* is four *bluus* together and not separated, but rather a form of a much larger plot with four sections

consisting of from 320 to 400 taro plants.

Traditional methods of propagating the taro also has its own ways of irrigation by means of water channeling through the patch so to provide water at all times. These channels usually run adjacent to small paths (terrace-like mounds) between *bluus* or *uleboels*. These mounds (*Eleiuis*) sometimes are used as paths and sometimes not and usually are planted with the giant taro and mainly used for the purpose of individually dividing patches belonging to different operators and regulating the flow of water in between the patches and sections in the whole taro patch.

Okak 1 *Uleoboel* only refers to those large taro patches that consist of several to many *uleboels* where a community may share different spaces that make up the whole taro patch (*mesei*). The Palauan traditional methods of operating a taro patch although so old are being exercised in the modern systems of farming and cultivation of land crops of today, and probably will continue into the far future.

Cassava

Cassava is a major item of food both in the villages where it is grown and in the urban markets (mainly in Koror). The cultivations of cassava in the Republic of Palau is gaining popularity between operators and probably will be the most cultivated crop by the time of the next census. The cassava cultivation is much easier than taro cultivation in taro patches where mostly old people are attending to these days. Most young operators concentrate on land cropping of all root crops and even taro which will eventually gain popularity, too.

CONCEPTS AND DEFINITIONS

Household - A household is one or more persons that live together and have their meals together.

Note that:

- Just one person, living on his/her own and looking after him/herself would be considered a household
- Usually a household will occupy one or more buildings but in a few **cases** two or even more households may share one building e.g. four households living in an

apartment building containing four apartments.

Head of Household- The person who is considered to be head by members of a household, that is, all persons living in the household.

Holding - A holding is a unit of agricultural land under single management comprising all livestock kept and all land used wholly or partly for agricultural production purposes, without regard to title, legal form or size. The holding's land may consist of one or more parcels, located in one or more separate areas or in one or more enumeration areas, provided the parcels share the same means of production used by the holding such as labor, farm buildings, or machinery.

Operator - An operator of an agricultural holding is the person who exercises management control over the operation of the agricultural holding. Where the holding is being operated by a single household, the head of the household in most cases is the operator. A holding can have more than one operator especially in cases where the holding is being operated as a partnership or some other form of joint operation. In some cases the operator is not necessarily the head of the household or the owner of the place.

Parcel - A holding parcel is any piece of land entirely surrounded by other land, water, road, forest etc., not forming part of this holding. A parcel may consist of one or more fields adjacent to each other. In other words a parcel is a contiguous piece of land in a holding. The entire land of the holding may consist of one or more than one parcel.

Plot - A plot is a part or the whole of a parcel on which a specific crop or crop mixture is cultivated. A plot can also contain fallow land and land ready for planting.

Land tenure - Land tenure refers to arrangements or rights under which the holder holds or uses holding land.

Level of Agricultural Activity

- 1 *Non-Agricultural* - the household does not engage in any crop production (such households may own or look after land Not in Use and also own or look after livestock and poultry).
- 2 *Minor Agricultural* - the household has only a few crops defined as less than 625 sq. yards (25 x 25 yards) of land under garden crops or less than 20 coconut trees or less than 20 banana plants or less than 20 other tree crops.
- 3 *Home consumption only* - The household produces crops for its own use but does not sell them.

- 4 *Mainly home consumption* - The household's main purpose of agricultural production is to feed itself but some crops or surplus crops are sold.
- 5 *Commercial (For sale)* - Households in this category differ from those in category 4 by the fact that their main purpose of production is to sell their produce either locally and/or for export.

Land Area - Land area will be measured in acres. There are 4,840 sq. yards in an acre. As a rough guide the following proportions of an acre are represented by squares whose sides have the following lengths:

Area in Acres	Length of	sides of square in yards
1		70
3/4		60
1/2		50
1/4		35
1/8		25

Single cropped - A single cropped pattern refers to one which has been planted in a regular pattern such as rows. If there are a few other trees/plants of different crops in scattered plantings over the plot, consider the plot to be single cropped to the one crop that is planted in a regular pattern.

Mixed Crop - A 'mixed crop' pattern refers to *two or more crops which are interplanted in a regular pattern such as rows*. Again if there are a few scattered plantings of other crops do not consider them to be crops that are interplanted in a 'mixed cropped' combination.

Scattered Crop - A scattered crop pattern refers to crops/plants which have not been planted in any regular pattern such as rows or some other uniform method of spacing. Scattered crops/plants are usually grown in small numbers and can often be found on single or mixed crop plots.

Table 1

From the 710 households enumerated, five categories were used to classify the level of each household and its agricultural activity. three categories classified households as Agriculturally active: (1) HOME CONSUMPTION ONLY, (2) MAINLY FOR HOME CONSUMPTION, and (3) FOR COMMERCIAL PURPOSES ONLY. The remaining two categories classified households as (1) NONE AGRICULTURALLY ACTIVE, (2) MINOR AGRICULTURALLY ACTIVE. In the

case of minor agricultural activities the household may be involved in agricultural activities or kept Livestock or poultry but did not have land of 1/8 acre or more under any garden crops growing or have 20 or more fruit bearing tree crops of one kind growing.

Table one shows the number of households that were enumerated in each state. The table also shows the number of households that were categorized under each categories by state. The table further shows the main purposes of each household involved ore not involved in agricultural activities, and lastly the table shows the number of full time farmers, farmers with other occupations and rest as household occupants that could be categorized as involved minorily or not involved in agricultural activities.

Table 2

The table shows the number of parcels that were being used and those under fallow by State. The table further shows the average of all parcels in holdings by State. In this census, all households that were involved in agricultural activities had only one holding and none claimed more than one holding. The table lastly shows the number of holdings that consisted of less than 1/10th of an acre of parcel area to parcels larger than 2 acres by State.

Table 3

The table shows the number of garden crops and tree crops counted and recorded under household categorized as minorily active in agriculture by state.

Table 4

The table shows the number of garden crops and tree crops counted and recorded under household categorized as minority active in agriculture by number and by State.

Tables 5 to 7

The table shows lands suitable for farming or which had been farmed before and left as fallow over 5 years (LAND NOT IN USE) with no agricultural activities of any kind. The table shows the number of cases by state and location by hamlet. The table also provides the land tenure of these lands not in use by number and by State. The land tenure where categorized as (1) CLAN OWNED, (2) PRIVATELY OWNED, and (3) LEASED to the head of the household or the farm operator.

Table 6 shows the number of cases where the land was not in use ranging from less than .5 acres to more than 5 acres in size by State and the number of years these lands had not been used by State. Table 7 shows the total acreage of all the land not in use by hamlet and by State.

Table 8

Table 8 shows the total population of Palau by State, and then divides the total population to household members under five years of age to seventy-five years of age and over. The table further divides the total population number to male and female household members by age and by State.

Table 9

Table 9 categorizes the household members into 15 categories and then subdivides the total number of members into male and female by State. The categories are:

- 1 cook
- 2 dependent
- 3 domestic helper
- 4 farmer
- 5 fisherman
- 6 government employee
- 7 private enterprise
- 8 housewife
- 9 missionary
- 10 part-timer
- 11 politician
- 12 public relations
- 13 retired
- 14 self employed
- 15 teacher
- 16 other

Table 10

Table 10 shows the total number of pigs in Palau broken down to number of sows (female pigs than have had litters), other pigs (boars, barrows, gilts, and growers), and piglets (sucklings still with sow), by State. The table also shows the number of pigs previously sold or given away in the 12 months before the census, by State. The table also shows the weight of pigs sold and given for custom purposes, by State. The census did not include livestock owned by the government and definitely missed including the few livestock owned privately. The government livestock includes 12 heads of pigs, 7 heads of goats, and 12 heads of cattle. There are known to be goats in the private sector of no more than 15 heads and no more than 10 heads of cattle. These data are always available in the monthly report of the livestock branch within the Division of Agriculture under the Ministry of Resources and Development.

Table 11

Table 11 shows the number of chickens (layers, culls, nonlayers, and chicks) by State, and then further shows the amount killed for home consumption by numbers and by pounds, and lastly provides the number of dozens of eggs sold in the last 12 months. It is obvious that the enumerators missed all the commercial poultry farms that had 12,000 layers in production. The enumerators also did not record any poultry of households that had fewer than 10 birds. Other poultry in Palau included about 600 muscovy and true ducks and less than 10 Guinea fowls.

Table 12 shows the total number of nuts used for human consumption, feeding animals, extract oil from for sale, and sold as nuts on a weekly basis, and then subdivide the amount of all nuts used to mature nuts and green nuts, by State.

The table also shows all the betelnut trees counted excluding betelnuts growing in parcel plots, and then divides the amount to those that were bearing fruits at the time of the enumeration and those that were not. The table also shows the number of bags (10-15 nuts per bag) of nuts collected in a month's time. Lastly, the table shows the number of cases where a household prepared local food for sale by State. The food prepared for sale ranged from agricultural products (locally grown) to single meals and snacks that are commonly seen in the markets and small retail stores. These foods prepared for sale consisted of imported food products most of the time.

Tables 13 to 16

The table shows the number of farm operators by number and range of age by State. Then the table subdivides the numbers to male operators and females operators by range of age and by State. The table also shows the number of operators by State and the average hours they spent working at their jobs and the average hours spent working at their holdings in a month. The tables also shows the number of operators and their work status in categories similar to those in table 9 in each State, and divides the total number to male operators and female operators by State.

Table 17

Table 17 shows the number of cases recorded where operators were using chemical materials in farm operations. Operators used one or more of the following:

- 1 Fertilizer
- 2 Pesticides
- 3 Herbicides
- 4 Fungicides
- 5 Composts

The second part of the table shows the number of cases where income was derived from agricultural activities by State and their proportions to the total income of each household recorded

by State.

Table 18

Table 18 shows the number of cases where either one or more of farm mechanical equipment were (1) OWNED, (2) HIRED, or (3) BORROWED FOR AGRICULTURAL ACTIVITIES. The table further shows the number of cases where equipment was hired or borrowed and the number owned by household in each State. In this case, enumerators had difficulties in differentiating between weed eaters and greenmachines, and tractors and rotavators/tillers. There are no more than five operating farm tractors on the island of which two are government owned.

Table 19

The table shows the number of parcels in use and fallow and years they have been in use and years they have been in fallow by state. Any fallow parcels over 5 years old was recorded as land not in use.

Table 20

The table shows the number of parcels in each state and divides them into categories. The three categories are clan owned, privately owned, and leased. It further shows the number of parcels less than 0.10 acre to parcels larger than 2 acres by State.

Table 21

The table shows the number of parcels in each hamlet by state that were less than 1/10 of an acre to more than 2 acres in sizes. This table does not include data from Ngiwal State, therefore one must understand that the information here are not accurate.

Table 22

Table 22 shows the number of cases recorded by hamlets by state were a parcel or parcels are situated. The table does not include all information presumably collected, coded, keyed properly, therefore tabulations turned out inaccurate data in this table.

Table 23

Table 23 shows the number of cases where trees not inside parcels but in the holdings were counted. Then, the table also shows the number of trees counted in each holding by State. Trees counted included any fruit bearing tree in the enumerator's tree crop list.

Table 24

Table 24 shows the total cases where trees were counted and the total number of trees counted by State excluding tree crops under households categorized as minorily active in agriculture.

Table 25

Table 25 shows the characteristics of paid labor in holdings in the last month of operation. The first part shows the laborers by sex, and then goes on to show if the laborer was a household member or not. Further down, the table shows the nationality of the laborer and then goes on to show the ages of the laborers. Finally, the table shows the number of laborers working or holdings less than 50 hours in a month to more than 200 hours in a month.

Table 26

Table 26 shows the number of cases of different kinds of crops grown in parcel plots by state. In this table a total of 5,240 cases of crops were growing in plots in all the states.

Table 27

Table 27 shows the number of cases where single crop was growing in a single plot in a parcel by State.

Table 28

Table 28 shows the number of cases where two or more crops were growing in a single plot in a parcel by State.

Table 29

Table 29 shows the number of cases where crops or a crop were/was growing in a scattered category in a single plot in parcel by state.

Table 30

Table 30 shows the number of cases where crops in plots were harvested for consumption only by state.

Table 31

Table 31 shows the number of cases similar to that of Table 30 but include only those cases where crops in plots were harvested both for consumption and for sale. When data of Table 31 is added to Table 30 data, the sum does not include the cases where all the cases of crops in plots were all sold. The approximate number of cases that sold all is 172 cases.

Table 32

Table 32 shows the total number of crops growing in plots in parcels by State. The numbers include crops growing under all categories from all to scattered.

Table 33

The table shows the number of crops in "All" category, where one single crop was growing in a single plot by itself, by State. These numbers does not include mixed and scattered categorized parcel plots.

Table 34

The table shows the number of crops that were growing in plots that fell under the mixed category by State. A mixed category is when two or more different crops are being cultivated and grown in a single plot.

Table 35

Table 35 shows the number of crops growing in the scattered category within plots in parcels by State. Scattered cropping can be only one kind of crop to several kinds of crops cultivated or grown in a single plot.

Table 36

Table 36 shows the number of crops that were strictly grown for home consumption purposes only by State. The number of trees in this table shows the number of tree crops where fruits are for house consumption only.

Table 37

Table 37 shows the number of crops that were grown for home consumption and for sale purposes by State. The number of trees in this table shows the number of tree crops where fruits are consumed at home and sold also.

Table 38

Table 38 shows the number of parcels with one plot to those with 8 plots by State. In this survey there were not more than 8 plots in a single parcel recorded in any State. The table goes on to show the number of plots that were whole (all), mixed, or scattered in Category by State. Further down, the table shows the proportion from 1/4 to ALL of all cases of crops in parcel plots were sold for profit and those that were not. In this case 288 cases were not stated under the 1/4 to All categories.

Table 39

Table 39 shows the number of cases where a plot was planted by a single crop by State.

Table 40

Table 40 shows the number of crops growing in all the plots recorded in table 39 by State.

Table 41

Table 41 shows the number of cases of different kinds of crops growing in areas less than 1/10 of an acre to 1 acre.

Table 42

Table 42 shows the number of crops counted in plots growing under these cases recorded in Table 41 in areas less than 1/10 of an acre to 1 acre.

Table 43

Table 43 shows the number of cases where a crop was previously growing and harvested in the parcel plots and harvested in the last 12 months by State. One has to be aware of the fact that subsistence farmers and small farm operators rarely keep records of what they plant and harvest in their farms on a year round basis, even daily, One must understand that the information provided in this table through table 47 is not accurate and for the most part misleading. The enumerators found that no single household enumerated had in possession a weighing scale or books for records of any farm. This census was based totally under the household level of Palauan families only. Therefore all commercial farms operated by foreigners were not included in this census.

Table 44

Table 44 shows the total acreage of parcel plots by State that were under crops and harvested in the last 12 months.

Table 45

Table 45 shows the number of plants planted and harvested in the last 12 months.

Table 46

Table 46 shows the weights recorded of plants in Table 45 that were harvested in the last 12 months.

Table 47

Table 47 shows the proportion of the crops harvested and sold in the last 12 months.

Table of Contents

Table 1. Level of Agricultural Activity of Households by State: 1994	1
